ARRAY OF STRINGS

newsOutlet

newsOutlet[0] → "abc"

newsOutlet[1] → "bbc"

newsOutlet[2] → "CNN"

ARRAY OF INTEGERS

```
int sum = numbers[0]+numbers[3];
```

sum → 15

ARRAY OF INTEGERS

numbers

12	1	777	3	4	0	0	121	1	-4	0	-100	2
0	1	2	3	4	5	6	7	8	9	10	11	12

```
int [] numbers = {12, 1, 777, 3, 4, 0, 0, 121, 1, -4, 0, -100, 2};
```

```
System.out.print(numbers[0]);
```

```
System.out.print(numbers[9]*numbers[12]);
```

Print output

12

-8

ARRAY OF DOUBLES

fracNumbers

0.4	6.2	3.75	5.1	9.9
0	1	2	3	4

```
double [] fracNumbers = {4.0, 6.2, 3.75, 5.1, 9.99};
```

**Pick
a random press**

newsOutlet

0	"abc"
1	"bbc"
2	"CNN"
3	"CBS"
4	"AP"
5	"NBC"
6	"FOX"
7	"npr"
8	"sky"
9	"Aljazeera"

PRESS CONFERENCE

```
String [] newsOutlet = {"abc", "bbc", "CNN", "CBS", "AP", "NBC", "FOX", "npr", "sky", "Aljazeera"};  
  
double lucky = Math.random();  
  
//Multiply by 10 to get a fractional number between 0 - 10  
lucky *= 10;  
  
//cast to integer to get an integer number between 0 - 9  
int luckyIndex = (int) lucky;  
  
System.out.print(newsOutlet[luckyIndex]);
```

lucky	lucky*10	luckyIndex
0.423	4.23	4
0.987	9.87	9
0.611	6.11	6
0.123	1.23	1

Print output
"AP"
"Aljazeera"
"FOX"
"bbc"

Arrays and Loops

```
public double calculateAverage(double [] temperatures){  
    int size = temperatures.length;  
    double total = 0;  
    for(int i=0; i<size; i++){  
        total += temperatures[i];  
    }  
    double average = total/size;  
    return average;  
}
```

Number of items
in the array

loop counter: (0, 1, 2 ...)

Arrays and Loops

{75, 73, 72, 80}

```
public double calculateAverage(double [] temperatures){  
    int size = temperatures.length; ← 4  
    double total = 0;  
    for(int i=0; i<size; i++){  
        total += temperatures[i];  
    }  
    double average = total/size; ← 300 / 4 = 75  
    return average;  
}
```

i	temperatures[i]	total
0	75	75
1	73	148
2	72	220
3	80	300
4		

Array bounds

```
int size = temperatures.length; ← 4
```

```
System.out.println(temperatures[10]);
```

Error!

ArrayIndexOutOfBoundsException

	Leaderboard	
	Trish McCallister	7.85
	Jayden McNeill	7.32
	Lucas Etter	4.9
	Michal Pleskowicz	6.22
	Jiayu Wang	5.4
	Kevin Costello	7.3
	Pavan Ravindra	5.19

ARRAY SEARCH

```
/**
 * Searches an array of speed
 * for the fastest (smallest) value.
 * @param speed array of speeds
 * @return double the fastest speed found
 */
public double search(double[] speed){
    int size = speed.length;
    double min = speed[0];
    for(int i=1 ; i<size ; i++){
        if(speed[i]<min){
            min = speed[i];
        }
    }
    return min;
}
```

Speed	
0	7.85
1	7.32
2	4.9
3	6.22
4	5.4
5	7.3
6	5.19

STRING ARRAY SEARCH

Write a function that searches an array of Strings and finds the longest string

```
public String findLongestName(String [] names){  
}
```

"Nakita"	"Elina"	"Sheree"	"Guy"	"Calandra"	"Perry"	"Heike"	"Harris"	"Lynsey"	"Issac"
0	1	2	3	4	5	6	7	8	9

REMEMBER:

`name.length()` returns the length of a string

STRING ARRAY SEARCH

```
/**
 * Searches an array of names
 * for the longest name.
 * @param names array of names
 * @return String: the longest name found
 */
public String findLongestName(String [] names){
    int size = names.length;
    String longestName = names[0];
    for(int i=1; i<size; i++){
        if(names[i].length() > longestName.length()){
            longestName = names[i];
        }
    }
    return longestName;
}
```

TIE BREAKERS ?

```
public String findLongestName(String [] names){  
    int size = names.length;  
    String longestName = names[0];  
    for(int i=1; i<size; i++){  
        if(names[i].length() > longestName.length()){  
            longestName = names[i];  
        }  
    }  
    return longestName;  
}
```

names	
0	"Anja"
1	"Kimberli"
2	"Edmond"
3	"Shenna"
4	"Apolonia"
5	"Caroll"
6	"Heike"

longestName ?

- ☐ "Kimberli"
- ☐ "Apolonia"
- ☐ Both of them
- ☐ None of them
